

Why build one app when we can build them all?

Somebody in this room is going to pitch an app. We'll fork a template, rebrand it, draw its wireframes and put it on the internet — before this session ends.

```
# the whole demo, four commands
gh repo create <your-idea> --template
TortoiseWolfe/ScriptHammer
./scripts/rebrand.sh <Name> <owner> "<one line>"
pnpm run sync:wireframes
git push # GitHub Pages does the rest
```

00:02 · THE PROMISE

Three claims, and you get to check all of them
